

CA Mail-Email/SMS Paging Notification

Complete Access Control & Remote Alerting System

The Email/SMS Paging Notification interface built in to the CA3000 V2.5 software enables users to relay important alarm event information to either an email address or by way of a text message to a pager or cellular telephone.*

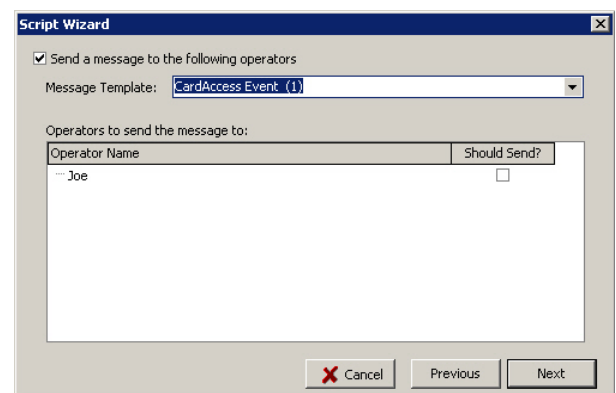

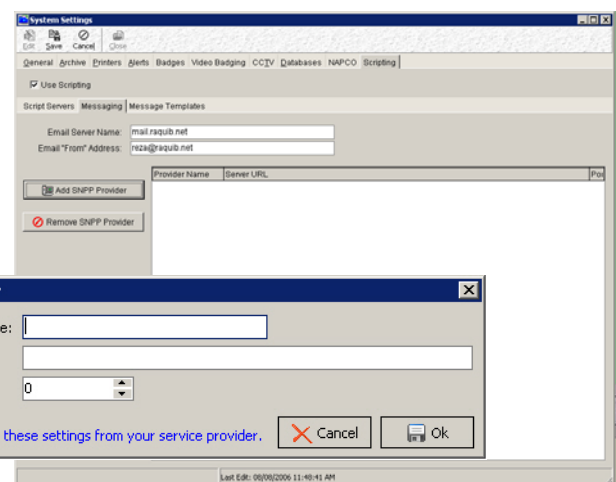

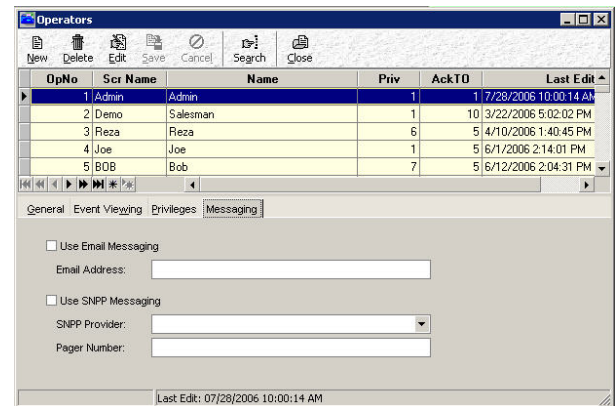

The CA Mail interface, as with all other features of the CA3000 software, is simple to setup and manage. The Administrator can easily specify which type of notification, (either email, text message or both) each operator may receive when an alarm event occurs. This way, no matter where the operator is when an important event occurs, he/she will know instantly that an event requires their attention.

The Administrator can select any event within the CardAccess 3000 software, including Napco Panel Alarm events, to be sent through this notification system. The alarm events are configured by way of a wizard-driven menu service called Scripting. The Scripting service allows the Administrator to select the event, or multiple events that they wish to send out via this notification service. Then select the operator or operators they wish to send the message to. It's that simple!

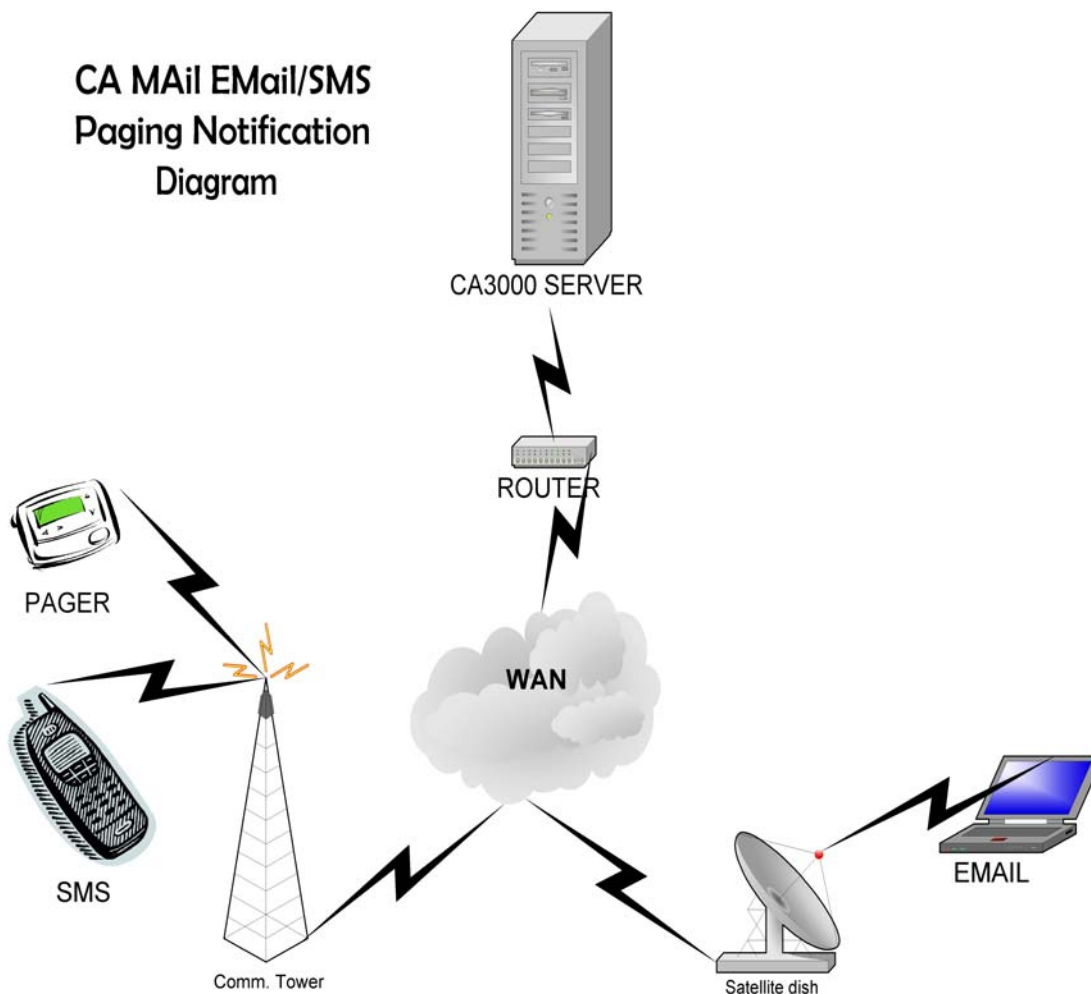

There is no limit to how many operators can be setup in the CA3000 software to receive remote alerts. In fact, each operator can be on a different cellular service or email service provider. The Administrator can configure an unlimited amount of service providers in the CA3000 program.

The CA Mail interface pays for itself in a short time by saving your company money by not requiring constant monitoring of the access system but your response can be just as swift as if someone was.

* Operators must have service with either a valid email address or a cellular phone service that provides SMS paging capability.
